Insight paper | Who pays for supporting the net zero transition

To hit net zero, consumers must look to electrified. However electricity is considerably more expensive than gas per unit for households. This paper outlines why the government should take action to disentangle policy costs from electricity bills to support consumers to make choices aligned with the net zero transition.

Our guest speaker from Ofgem discusses findings from Ofgem's publication on the future of system and why it has made recommendations to government that the System Operator should have greater independence. They discuss implications for how roles may change in future in system balancing and system planning, and why this is important to meet net zero.

Podcast | Talking to Ofgem about the future of System Operation

Interest in private wire arrangements has grown in recent years, with the benefits of network and policy cost avoidance becoming a key incentive for. In this 'Chart of the week', we look at the expected evolution of cost avoidance over the next five years and consider the impact of ongoing network reforms.

Blog | Have we given up on competition in the retail market?

"Q: How does 2pm on Wednesday sound? A: Assuming we still have a functioning energy market that'd be great".

In this blog, we will make a case for keeping competition in the retail energy market amidst the carnage of a commodity storm.
